For several years, Betty has been managing her cholesterol levels by living an active and healthy lifestyle. Recently she broke her hip and though she’s recovered, she now has lingering musculoskeletal challenges and walks with a slight limp. Although Betty eats healthy and watches her cholesterol intake closely, she finds it challenging to exercise due to her disability. At her most recent check-up, she learns her cholesterol levels have crept up again.

For millions of Americans, diet, exercise and statin therapy can control cholesterol levels. But, for patients like Betty, a significant unmet medical need remains, underscoring the need for continued innovation to help patients live longer, healthier lives.
